

1. Student Eligibility Check

The student enters their academic marks, fee budget, and optional details like city or preferred program.

The system compares this data with the university dataset and shows a list of universities where the student is eligible based on merit requirements and fee criteria.

2. University Filters

Students can apply filters to narrow down university options.

They can filter by:

City (e.g., Lahore, Karachi, Islamabad)

Degree program (CS, BBA, Engineering, etc.)

Fee range (minimum to maximum budget)

Merit range (e.g., merit above 80%)

And other optional requirements

This helps students find universities that match their exact preferences.

3. Compare Universities

Students can pick 2–3 universities and compare them side-by-side.

The comparison includes:

Fees (annual or per semester)

Merit requirements

University ranking

Location / Distance etc

This feature helps students make better decisions between similar options.

4. Program-wise Recommendations

Students can choose their interest area (Engineering, CS, Business, Medical, Arts, etc.).

The system will then show the best universities in that specific field based on:

Merit

Fees

Ranking

Programs offered etc

This makes the search more personalized.

5. Add to Favorites / Shortlist

Students can save or bookmark universities they like.

Their shortlist stays saved so they can come back later and compare or apply.

This improves user experience and makes the process easier.

6. University Ranking System

Each university will have a ranking score or category.

Rank can be based on:

HEC Ranking

Program ranking

This helps students identify top universities quickly.

7. Last 5 Years Merit History

Every university page can show the merit trend for the last 5 years.

Example:

2020: 78%

2021: 80%

2022: 82%

2023: 83%

2024: 84%

This helps predict if merit is rising or stable — making decisions easier.

8. University Distance Calculator

The system calculates how far each university is from the student's home.

Using the student's location (or manually entered address), the system shows:

Distance in kilometers

Approximate travel time

Whether transport is required or optional

This is extremely useful for choosing nearby universities.
